sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention provides a number of nucleotide and protein

These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotides derived from Coryneform bacteria, for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79534 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleocides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids,

```
The present sequence is the total DNA sequence from cosmid clones IP(2)127 and LP(2)128, which contains a Streptomyces aureofaciens (ATCC 13899) DNA that encodes the proteins of the entire chlortetracycline biosynthetic pathway. The biosynthetic gene, which can be expressed in heterologous hosts, especially S. lividans, may be useful in the production of antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           무

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The control of the biosynthetic production pathways of chlortetracycline, tetracycline, or their derivatives. One plasmid contains an origin of tetracycline, or their derivatives. One plasmid contains an origin of replication, an actinomycete (such as Streptomyces lividans, s. ariseofuscus, or S. ambofaciens) active antibiotic resistance gene and three or more tandem cohesive end sites. The second plasmid contains an actinomycete active origin of replication and three or more tandem cohesive end sites. The invention can be used to clone a large amount of genetic material for the heterologous production of the antibiotics, chlortetracycline, tetracycline and their analogues. A cluster of genes transferred in its entirety to a heterologous host. The invention specifically relates to cloning of the entire tetracycline and chlortetracycline from Streptomyces aureofaciens and its expression in a heterologous host such as S. lividans. The present sequence represents a necofaciens bux sequence from the cosmid clones designated LP2-127
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to combination of two plasmids for cloning the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Two plasmids for cloning the biosynthetic pathways of tetracycline, chlortetracycline, and their derivatives - comprise an origin of replication, cohesive end sites and optionally, an antibiotic

Bacteria signal to one another to coordinate expression of specific genes in a cell density dependent fashion. This "bacterial signalling" is called "quorum senasing and response". Quorum senasing allows a bacterial species to sense its own number and regulate gene expression according to species to sense its own number and regulate gene expression according to population density. The present sequence is an open reading frame (ORF) of a Pseudomonas acruginosa quorum sensing signalling renders a bacterial population more susceptible to treatment. The present invention relates to a method for identifying modulators of quorum sensing signalling in Pseudomonas acruginosa bacteria. Modulators of quorum signalling may be used to treat P. acruginosa infections. P. acruginosa is an opportunistic pathogen of immunocompromised individuals (burn patients, cystic fibrosis patients, patients undergoing immunosuppressive therapy and patients with AIDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying modulators of quorum sensing signaling in Pseudomonas aeruginosa bacteria, useful for treating infections in immunocompromized patients -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            148
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  209294
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               208913
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the genomic sequence of Pyrococcus abyssi and P. abyssi proteins (see AAB96053-AAB96842). P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. abyssi. The 5' end of this sequence overlaps with the 3' end of AAH41224 and the 3' end of this sequence overlaps with the 5' end of AAH41226 archeins of the present invention have various potential industrial uses since the proteins are stable at very high temperatures, some up to 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: This patent is in the same patent family as W0200055062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300001..349980

The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFs) 8-30. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty to produce a polycected with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazoline, bithlazoline and bithlazoline-containing
                                                                                                                                                                                                                                                                                                                                                     microbial metabolites. The BLM gene cluster may also be used to produce

The invention provides polyketide-like synthesis (PKS)-like genes that

are used for the production of long chain poly-unsaturated fatty acid

(PUPA) productions. Genes responsible for eicosapentenoic acid (EPA)

production in Shewanella putrefaciens and novel genes associated with the

production of docosahexanoic acid (DHA) in Vibrio marinus are used to

production of docosahexanoic acid (DHA) in Vibrio marinus are used to

certain plants and microbial cells to give recombinants having altered

contents of PUPA (Specifically DHA and EPA). Oils from these plants are

contents of PUPA (Specifically DHA and EPA). Oils from these plants are

cuseful as dietary supplements (in infant feeeding formulations, to give a

pupa profile closer to that of human milk; for treating mainutrition; in

intravenous feeding formulations; in cooking oils, fats etc.), also as

cut-inflammacory agents and for reducing cholesterol levels. Fragments

content corganisms that express PKS-like genes. The method facilitates

canti-inflammatory agents and for reducing pathways for their

content corganisms that express PKS-like genes. The method facilitates

clarge scale production of PUFA by providing new pathways for their

synthesis or suppressing interfering pathways. Expression of PUFA in

seeds allows simple recovery, as oil which can be engineered to have a

particular PUFA profile. Expression in microbes also allows simple

recovery and control of PUFA profile and is not subject to external

variables such as weather or food supply. The present sequence represents

comprising open reading frames (ORFS) 6, 7, 8 and 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding polyketide-like synthesis enzymes of Vibrio marinus - and transformed plants and microbes that produce polyunsaturated fatty acids, useful as pharmaceuticals and food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 40138 BP; 11845 A; 7635 C; 8758 G; 11900 T; 0 other;

This invention describes novel DNA sequences encoding for polyketide (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio and Schizochtrium. The nucleic acids are useful for isolating related molecules or in methods to detect organisms expressing the PKS-like genes. They are also useful for creating transgenic plants that express poly-unsaturated long chain fatty acids. The poly unsaturated long chain fatty acids are useful as dietary supplements for patients undergoing intravenous feeding or for preventing or treating malnutition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats or margarine formulated so that in normal use the recipient receives a desired amount of poly-unsaturated organisms chain fatty acids. The nucleic acids are also useful in large scale long chain fatty acids. The nucleic acids are also useful in large scale condition of the fatty acid profile of host cells and edible plant tissues and/or plant parts. Transgenic production of polyunsaturated catty acids in particular host cells allows quicker purification from natural sources such as fish or plants. This sequence represents a vibrio marinus DNA fragment encoding the PKS gene cluster incorporating
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New DNA sequences encoding for polyketide (PK)-like synthesis pathway genes from Shewanella, Vibrio and Schizochtrium, useful for creating transgenic plants that express poly-unsaturated long chain fatty acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 40138 BP; 11845 A; 7634 C; 8759 G; 11900 T; 0 other;

Ξ
 The present invention provides a DNA sequence encoding an icosapentaenoic acid-blosynthesising enzyme group-like protein group derived from a microbe having docosahexaenoic acid (DHA)productivity. The gene can be used for the industrial production of DHA. The present sequence is a coding sequence described in the exemplification of the invention.
                                                                                                                                                                                                                                                                               Gene of a docosahexaenoic acid-producing microbe, used for industrial production of docosahexaenoic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 41587 BP; 12323 A; 7885 C; 9126 G; 12253 T; 0 other

Plants were grown in the greenhouse at the University of Callifornia, Riverside (Fenton, 57 close, TJ Close), Whole spikes with awas prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids in the TJ Close lab at the University of Callifornia, Riverside (Choi). Phagemids were plated and picked at the Clemson University of Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Netchr sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see http://www.genome.clemson.edu/projects/barley. To order this clone see http://www.genome.clemson.edu/projects/barley. To order this clone see http://www.genome.clemson.edu/projects/barley. To Genetically and physically anchored EST resources for barley genomics. Barley Genetics Newsletter 31:29-30. /lab_host="Vector: lambdaZAP; Site_l: EcoRl; Site_2: Xhol;
Sods were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 50c for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations DNA sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://www.genome.clemson.edu/projects/barley. University, The Netherlands). The CSTA libraries will attempt to capture the induction and initiation/initial growth of the tuber in an in vitro system as described in Bachem et al. (Plant Journal, 1996). Small microtubers develop from axillary buds attached to stem explants when placed on a high sucrose medium (10%). Visible morphological changes occur synchronously at day five in the axillary buds harvested on days 1-3. This targets of axillary buds harvested on days 1-3. This targets those genes involved in induction of the microtubers. The following libraries, CSTA (21-40) and CSTA (41-60), capture genes involved in tuber initiation and outgrowth. This library is noted as P3 in Tanksley lab notebooks."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       342

/note="voctor: Lambda Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Gigapack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-ZAP XR vector using ExAssist
helper phage and the E. coli strain XIL-Blue MRF.

These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA

```
preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see http://www.genome.clemson.edu/projects/barley. /de__stage="Five day old etiolated seedling"
/lab.host="E. coli SOLR"
/lab.host="E. coli SOLR"
/note="Vector: Lambda Uni-ZAP XR, excised phagemid:
Site_1: EcoRi; Site_2: XhoT; Seeds were surface-sterilized
, germinated and grown aseptically in the dark at room
temperature on filter paper with water, nystatin and
cefotaxime in covered crystallization dishes. Roots were
harvested. The tissue, total RNA, and poly(A) RNA were
prepared, a CDNA library was made, and the CDNA clones
were in vivo excised to give pBluescript phagemids in the
TJ Close lab (Choi, Close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all
other authors)."

    Sequence 16, Application US/09385028
    Patent No. 632106
    APPLICANT: Susan E. Jensen
    APPLICANT: Kwamena A Aidoo
    APPLICANT: Ashish S. Paradkar
    TITLE OF INVENTION: DNA Sequence Encoding Enzymes of Clavulanic
    Patent No. 63213106
    TITLE OF INVENTION: Acid Biosynthesis
    TITLE OF INVENTION: Acid Biosynthesis
    NUMBER OF SEQUENCES: 25
